Hello,  
One of my concerns has not been sufficiently explained.

Water.

It seems only logical to assume that water drawn from an aquifer deeper than the one above it will have an effect on both. Similar to water sucked up from the bottom of a glass through a straw. Even though it is pulled from the bottom of the glass, the level at the top of the glass changes. It has been argued that the rock separating the aquifers is impermeable. So is my roof. Unless there is a leak.

I urge that this project be denied.
